TAMIS

For patients with polyps in the low rectum, Transanal Minimally Invasive Surgery (TAMIS) may be used to remove the polyp. This is a relatively new procedure which allows the surgeon to achieve a better view in the low rectum. When you are asleep, a flexible port is inserted transanally along with laparoscopic instruments to remove the polyp without the use of any external incision whatsoever. By performing the surgery trans-anally, we can achieve incision-less surgery. Patients often have minimal pain after surgery, and most often do not require any overnight hospital stay.

OPEN INCISION
CLOSED WITH STAPLES

LAPAROSCOPIC PORT INCISIONS

TAMIS
NO SKIN INCISION
